Identifying gene signatures in 3'-directed human cDNA library for diagnosis of abnormal cell function, by preparing cDNA that reflects relative abundance of corresp. mRNA in specific human e 9

Claim 1; Page 991-992; 2245pp; Japanese

A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in AAT19001-T26837 and which is able to hybridise to part of human genomic DNA, CDNA or mRNA is claimed. The GS (Gene Signature) from various human tissues; synthesis of cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. different mRNAs in the particular tissue The appearance frequency of a given GS in determined (esp. using primers and probes probes derived in a cDNA library from the င္သ be.

> SSSS Sequence 301 BP; 96 A; 65 C; 63 G; sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. 66 T; 11 other;
